I.- PRESENTACIÓN

I.- PRESENTACIÓN

Durante la realización del Máster en Documentación y Sistemas de Información Sanitaria, creado y dirigido por el Profesor Pedro Navarro Utrilla, el doctor José Antonio Líbano Zumalacarregui me propuso continuar con el trabajo desarrollado por él en el análisis bibliométrico de la literatura científica.

Después de unos años de esfuerzo constante, en los que tuve que combinar mi trabajo profesional como Especialista en Urología en el Hospital Universitario "12 de Octubre" y el desarrollo del tema de investigación aquí expuesto llegamos a la finalización de esta fase del estudio con la presentación de una ilusión en que consiste toda obra de investigación.

La actividad profesional dentro del Servicio de Urología del Hospital 12 de Octubre me fue encaminando hacia el problema del deficiente desarrollo de los Sistemas de Información dentro del complejo mundo de la Documentación Científica, y sobre todo a su deficiente calidad en muchos casos.

Una gran parte de las decisiones que se deben tomar se realizan con una base aproximativa al no conocerse adecuadamente la realidad sobre la que se sustenta el Sistema de Información.

Este trabajo de investigación tiene su base en el desarrollo del Proyecto de Investigación, dirigido por el doctor José A. Líbano que desarrolló en 1994, con el título de "Evaluación de la Productividad Bibliográfica Biomédica".

Gracias a su apoyo se inició este trabajo de investigación fundamento de la Tesis doctoral titulada "ESTUDIO DE LA PRODUCTIVIDAD BIBLIOGRÁFICA SOBRE TRASPLANTE RENAL Y CICLOSPORINA, EN EL PERÍODO 1986-1992 ".

Quiero testimoniar mi más sincero agradecimiento al Prof. Pedro Navarro Utrilla, Director del Proyecto DOSIS 2000 del Departamento de Medicina Preventiva, Salud Pública e Historia de la Ciencia, de la Universidad Complutense de Madrid.

Me gustaría destacar la colaboración eficaz, amable y cordial del personal del Proyecto DOSIS 2000, especialmente de Marivi González Abad y Mar Rodríguez Pérez.

A mi mujer, a mis hijas, y a mis padres, que me apoyaron en todo momento; a los compañeros del Servicio de Urología del Hospital 12 de Octubre, en especial al personal del C.E.P. de Carabanchel por la importante labor que realizan día a día.

Muy particularmente deseo expresar mi más profunda gratitud al doctor José A. Líbano, artífice de todas las ideas motrices y creador exclusivo de los programas informáticos que han cimentado el desarrollo del trabajo; así como al doctor

Miguel Sordo por sus generosos y denodados esfuerzos, sin cuyo concurso difícilmente hubiera concluido la redacción final de esta tesis doctoral. De ambos he recibido acreditadas enseñanzas de inquietud científica y sobradas pruebas de amistad sin límites, cualidades expresivas del peculiar ambiente del Proyecto DOSIS-2000.

II.- INTRODUCCIÓN

II.- INTRODUCCIÓN

Como Urólogo estudioso me preocupa un tema de candente actualidad como es el impacto sociosanitario que representó la aparición de la droga inmunosupresora llamada "Ciclosporina" en la realización del Trasplante Renal.

Por ello nuestro interés gravita en conocer en el contexto mundial quienes son los autores que trabajan con un mayor nivel en este área de conocimientos y su calidad. Para lo cual utilizamos la productividad científica a través de la productividad bibliográfica.

Una publicación puede considerarse de interés por estar muy citada durante un corto período de años, pero no indica que sea superior a otra que en el transcurso de los años mantiene cierta vigencia. (LÍBANO JA, et All)

La realización de este proyecto se fundamenta en el trabajo realizado por el doctor José A. Líbano Zumalacarregui "Evaluación de la productividad bibliográfica biomédica" y que fue aprobado como beca FISS 93-94 (Nº 93/1328). (LÍBANO JA).

Siguiendo lo indicado por Líbano nos pareció un puntual medidor reflejo de calidad, el estudio de las publicaciones de los diferentes autores por el esfuerzo que conlleva el estar al día.

Los resultados están probados sobre la producción bibliográfica de diferentes colectivos, los investigadores oncológicos de diferentes países (Francia, Italia, Inglaterra y España), y estudio de los investigadores Españoles de cualquier especialidad durante el trienio 90-92.

La circulación de los trabajos médicos, como se sabe, se efectúa a través de bases de datos de información bibliográfica, principalmente la nacional a través de IME (Índice Médico Español) y la internacional mediante MEDLINE (Index Medicus), EMBASE (Excerpta Médica), BIOSIS (Biological Abstracts) y SCISEARCH (Science Citation Index, Current Contents).

Como indicadores de circulación pueden emplearse principalmente tres: El número de trabajos circulantes, el Índice de Productividad Circulante (logaritmo del número anterior) y el Índice de Circulación (cociente entre el número de trabajos circulantes y el de publicados). Una variante de este último es el Índice de Difusión Internacional propuesto por Benito Amat y de la Cueva Martín, consistente en el cociente entre el número de trabajos circulantes en las cuatro bases internacionales de datos recién citadas y la cifra de publicados multiplicada por cuatro. Por ejemplo, todos los artículos que publicó Medicina Clínica en 1988 (627) circularon tanto en IME como en MEDLINE y SCISEARCH, lo que corresponde a un Índice de Productividad Circulante de 2.80 y a un Índice de Circulación de 1.

Por otra parte, en EMBASE lo hicieron 122 artículos (Índice de Productividad = 2.08 e Índice de Circulación = 0.19) y en BIOSIS, 322 (Índice de Productividad = 2.50 e Índice de Circulación = 0.51). Dicho año, el Índice global de Difusión Internacional de la revista a través de estas cuatro bases de datos fue de 0.68.

Los Índices de Circulación se encuentran entre los indicadores bibliométricos más válidos y fiables para la evaluación. Tienen un sólido fundamento y no están afectados por problemas como la discusión en torno a las funciones de las citas en la comunicación científica, y disponen de varias bases de datos sin los errores y limitaciones de Science Citation Index, cuyas cifras pueden compararse.

Hay que recordar que el Índice de Productividad es considerado por los más exigentes especialistas en bibliometría el más adecuado para la valoración comparada de autores y grupos.

La dispersión de la información científica, en especial de la publicación en revistas, es una cuestión de claro interés teórico y de gran importancia práctica. Uno de los primeros requisitos para planificar racionalmente la información científica es, en efecto, conocer la distribución de la literatura relativa a una disciplina o a un tema determinado en zonas de diferente densidad.

Los estudios descriptivos han puesto de manifiesto la extraordinaria variabilidad de esta distribución. En ocasiones, los trabajos se concentran en un número muy reducido de revistas, mientras que en otras se dispersan en una cifra muy elevada. Algunas veces, la zona de máxima densidad coincide con revistas especializadas en el tema, pero muy frecuentemente corresponde a otras de carácter general o consagradas a aspectos científicos directa o indirectamente relacionados con el tema en cuestión.

También, ya se ha dicho que los indicadores de repercusión se obtienen a partir del análisis de las citas. Las limitaciones que significaba su recuento bruto comenzaron a ser superadas, como sabemos, por Raisig y Westbrook, quienes en 1960 propusieron independientemente un Índice de Impacto, consistente en el cociente entre citas recibidas y trabajos publicados. Sin embargo, su obtención significaba costosísimos trabajos analíticos.

Garfield fundó en 1964 el Science Citation Index, que ha difundido principalmente este mismo indicador con el nombre de Factor de Impacto.

El FI de una revista en un año determinado se calcula a partir del número de artículos publicados por esa revista en los dos años anteriores citados por las revistas incluidas en el SCI durante el período de dos años, dividido por el número de artículos publicados por la revista en cuestión. Las

características del SCI han sido descritas previamente por otros autores y recientemente en Medicina Clínica. Pese a sus indudables limitaciones, supone la primera medida objetiva, cuantificable y estable de valoración de lo que una revista supone en el ámbito científico y , por ello, ha ido ganando aceptación por parte de la comunidad científica.

La facilidad con que este repertorio permite conseguirlo ha difundido, por desgracia, su empleo indiscriminado y al margen de toda cautela, tal como venimos diciendo. Dicho empleo acrítico no tiene en cuenta, en primer lugar, las advertencias del propio Garfield, que ha repetido innumerables veces que es un indicador relativo, que no debe aplicarse para comparar revistas, grupos o autores de disciplinas distintas. En segundo lugar, ignora el debate en torno a las funciones de las citas en la comunicación científica que, como se ha visto, son muy complejas -y en absoluto sirven de fundamento a interpretaciones simples. En tercer lugar, desconoce las limitaciones del Science Citation Index, comenzando por su extremado sesgo, que refleja más la tibetización de la cultura científica norteamericana que la estructura de la producción científica internacional, y terminando por sus lagunas y errores. Estos últimos, principalmente la mención exclusiva del primer firmante, los homógrafos de los nombres de los autores (que pueden referirse, como advierte el propio Garfield, a una serie de autores diversos) y las equivocaciones de dichos nombres y de las referencias bibliográficas de las revistas, exigen que para su utilización

sea necesaria una verificación cuidadosa, si se quiere evitar una proporción de errores que se ha calculado en un 25% aproximadamente.

Con la finalidad de superar el carácter relativo de los indicadores de impacto basados en el cómputo de citas se ha propuesto una amplia serie de procedimientos, entre los que destacan el que Narin y Pinski llaman "método de las influencias ponderadas" y las varias tasas relativas de citas de Braun et al. y Schubert y Gränzel. El primero, que parte de la idea de que el "índice de influencia" de una revista puede medirse mediante el cociente de las citas que recibe y las referencias que emite, se basa en el cálculo matricial. Sin embargo, los indicadores que proporciona este método y también las tasas relativas de citas propuestas por estos autores son de ejecución nada sencilla y de interpretación discutible, lo que resulta poco rentable si se limitan, como sucede en ambos casos, a los datos procedentes del Science Citation Index. (LÓPEZ PIÑERO ET ALI 1992).

Evaluar la calidad de las publicaciones científicas nunca ha sido una tarea fácil. Para ello se requieren expertos altamente cualificados en la materia (el principio de "control por los iguales") y si quiere completarse con rigor, un considerable número de horas de trabajo.

Hay quienes consideran que la solución podría encontrarse con la aplicación de indicadores bibliométricos; estos índices

se basan en la frecuencia con la que un artículo aparece como cita en el Science Citation Index (SCI). Automáticamente, muchos investigadores entenderían que, cuanto mayor número de veces es citado un artículo, mayor es su calidad científica. Sin embargo, esto es sólo parcialmente cierto. En primer lugar, hay que dejar claro que la cita de un artículo en el curso de otra publicación científica es, más que una medida de calidad del primero, una herramienta de trabajo para el segundo.

Es posible argumentar que, en ausencia de otros métodos de evaluación satisfactorios, la frecuencia de citación "per se" podría servir como medida fiable de los logros científicos, puesto que mide el impacto de un artículo en la comunidad científica. Sin embargo, incluso así, sería cuestionable el que un análisis de citas constituya realmente el baremo apropiado para la jerarquización de científicos o grupos de investigación.

El parámetro de citación más asequible es el factor de impacto de revista o índice de impacto, que representa la media de la frecuencia anual de citación de todos los artículos publicados en una revista médica determinada. Este índice oscila, para todas las revistas de cierta relevancia, de 20 a casi cero y se publica cada año en la sección "Journal Citation Reports" del SCI. Para dar una idea, y como patrón de referencia, la media con que un artículo científico aparece citado en la bibliografía mundial, es de 1.5 veces al año,

(incluyendo autocitaciones).

¿Sería más adecuado para tal valoración usar como parámetro la frecuencia de citación de un artículo?. Mejor quizás sí, pero no lo suficientemente bueno. La frecuencia de citación constituye una de las más amplias distribuciones encontradas en la investigación sociológica, e incluso dentro de un mismo grupo de investigación es extremadamente variable. Únicamente los grupos de investigación con mayor producción científica y sólo si son seguidos durante largos períodos de tiempo podrían ser evaluados, con alguna fiabilidad, con este criterio. La diferencia entre dos grupos así comparados, tendría que ser muy grande para resultar estadísticamente significativa (SEGLEN 1993).

En los últimos años el mundo de las publicaciones biomédicas ha experimentado también la llamada del control de calidad. Junto a aspectos formales, como la adopción de las normas uniformes de publicación, cada vez preocupa más el fondo, es decir la calidad de lo que se publica. Ello tiene especial interés al evaluar la producción científica y cuando se realizan comparaciones entre revistas, como, por ejemplo, en concursos u oposiciones a plazas docentes o investigadoras.

La indización en bases de datos internacionales se ha considerado en los últimos años como un indicador de calidad, pero en el último decenio se ha valorado cada vez más el denominado Factor de Impacto (impact factor, FI), elaborado

desde hace años por el Institute of Scientific Information y publicado anualmente, en lo que a revistas se refiere, en la sección Journal Citation Reports (JCR) del Science Citation Index (SCI).

Hay que destacar el limitado valor del español como lengua científica, la calidad de la ciencia biomédica publicada en revistas españolas y la inclusión de éstas en los índices internacionales.

Desde hace años es evidente que el inglés ha sustituido al francés y al alemán como lengua internacional de difusión científica.

Los científicos de países hispano-hablantes prefieren las publicaciones en inglés a la hora de difundir sus investigaciones. Adicionalmente, es un hecho reconocido que los autores españoles envían sus mejores trabajos a revistas internacionales antes de recoger las de lengua española y dejan éstas para trabajos de menor calidad o en aquellas situaciones en que han sido rechazados por publicaciones de lengua inglesa. Es decir existe una auténtica "fuga de originales de calidad" a revistas internacionales.

Las publicaciones españolas en inglés disfrutan de FI más altos que las realizadas en español.

El FI se obtiene precisamente a partir de las referencias

bibliográficas de las revistas presentes en el SCI. En general, los artículos de una determinada revista contienen un número inevitable de referencias de artículos publicados en la misma publicación. Tal hecho colabora indudablemente a aumentar el FI de las revistas incluidas en el SCI frente a las que no lo están. Por ello es muy meritorio para una revista el estar incluida en el SCI-JCR cuando no se encuentra indizada en el SCI ya que significa que la totalidad de las citas debe obtenerlas de otras revistas, que deben incluirla en sus referencias bibliográficas. En España, éste es el caso de todas las revistas del área clínica, sobre todo de aquellas publicadas en español, como Nefrología o Medicina Clínica, que son las publicaciones de investigación clínica que obtienen las puntuaciones más elevadas. Aunque algunos autores han minimizado la cuestión de la inclusión en el SCI no parece arriesgado sugerir que la inclusión de tales revistas comportaría un aumento sustancial de su FI al incorporarse el componente de autocitas del que en la actualidad no se beneficiarían. Medicina Clínica está presente en el conjunto de revistas incluidas en el SCI, constituyendo la primera publicación clínica española que accede a este índice. La evolución de su FI antes y después de su inclusión tendrá, sin duda, gran interés para valorar la influencia de este factor en las puntuaciones de FI alcanzadas por Medicina Clínica.

Otro punto importante a considerar es que el FI se calcula teniendo en cuenta las citas a trabajos publicados en los dos años anteriores. La mayor dificultad que comporta el

acceso, para autores no españoles, a revistas españolas así como la inclusión más tardía de los trabajos en bases de datos de bibliografía científica pueden influir en que las citas que reciban los trabajos de revistas españolas sean anteriores a los dos años que se contemplan en el FI con lo que los trabajos se conocen y, en consecuencia, se citan más tardíamente. A este lapso de tiempo entre publicación de un trabajo, conocimiento del mismo por otros autores, obtención de una copia y cita en un manuscrito, hay que añadir el tiempo, generalmente de varios meses que transcurre entre la redacción y la publicación de un trabajo, por lo que es fácil superar el período establecido para el FI.

No cabe duda de que el FI tiene inconvenientes importantes: favorece áreas con un número elevado de investigadores frente a otras que cuentan con un reducido número de ellos, discrimina positivamente a las revistas que publican revisiones frente a las que sólo publican originales y puntúa mucho más a las revistas de lengua inglesa que a las que no lo son, tanto a la hora de su inclusión en el SCI, como por cuanto el conocimiento de los artículos de estas últimas puede ser más tardío, con las consecuencias comentadas previamente.

Pese a todas sus limitaciones, es difícil no aceptar la opinión de que el FI constituye uno de los medios, para valorar la influencia de una revista en el mundo científico internacional (BAÑOS ET ALL 1992).

Los indicadores bibliométricos son primariamente datos numéricos sobre fenómenos sociales de la actividad científica relativos a la producción, transmisión y consumo de la información en el seno de comunidades determinadas. En modo alguno pueden considerarse como mediciones de importancia y menos de calidad y su utilización está condicionada en las evaluaciones por contextos siempre muy complejos de los fenómenos sociales a los que cada uno de ellos se refiere.

Los perjuicios que el empleo acrítico de indicadores bibliométricos está causando en España y, en concreto, en el campo de la medicina, son muy considerables.

Como se tendrá ocasión de comprobar, esta práctica se asocia de forma constante a un completo desenfoque de la posición de nuestra medicina, y muy especialmente de nuestras revistas médicas, en el panorama internacional. Aparte de las injusticias y desmoralizaciones personales que produce, tal asociación está desorientando a muchos grupos de médicos españoles de valía y conduciendo a una auténtica crisis de nuestras publicaciones periódicas especializadas. Resulta paradójico que dicha crisis se produzca en un momento en que las condiciones reales de todo tipo, lejos de justificar esa tendencia suicida sin precedentes en ningún país de desarrollo científico medio, permiten una reestructuración rigurosa que podría llevar a una importante elevación de la calidad de nuestro entorno científico.

En casi todos los países existen hoy departamentos universitarios o centros de investigación consagrados al área, algunos de los cuales son de nueva creación, mientras que otros se han constituido por fusión de unidades anteriores de disciplinas concretas. Este es el caso, por ejemplo, del Instituto de Estudios Documentales e Históricos sobre la Ciencia, centro mixto de la Universidad de Valencia y del Consejo Superior de Investigaciones Científicas (CSIC), fundado en 1985, que integra unidades de documentación científica e historia de la ciencia de las dos instituciones, entre ellas, el Centro de Documentación e Informática Biomédica y la Cátedra de Historia de la Medicina.

La función de los indicadores de actividad científica no puede limitarse a amontonar datos estadísticos yuxtapuestos. Hay que integrarlos para conseguir explicaciones lo más sólidas que sea posible acerca de las actividades relacionadas con la ciencia, en general y en sus aspectos concretos.

Más compleja es la cuestión de si la actividad científica se entiende en sentido amplio o estricto. Si se hace en un sentido muy amplio, incluyendo la investigación, la enseñanza y la difusión social de los conocimientos científicos, se abarca un número mucho mayor de actividades.

Especial trascendencia tiene la opción de abordar conjuntamente o por separado "ciencia" y "tecnología".

En la actualidad se han impuesto de modo indiscutible los indicadores específicos de la actividad científica claramente diferenciados (LÓPEZ PIÑERO, TERRADA 1992).

Siguiendo el trabajo elaborado por CAMI ET ALL (1993), sobre "LA PRODUCCIÓN CIENTÍFICA ESPAÑOLA EN BIOMEDICINA Y SALUD. UN ESTUDIO A TRAVÉS DEL SCIENCE CITATION INDEX (1986-1989)" comprobamos como en cada una de las instituciones más productivas se ha desagregado la información para poder determinar centros de excelencia según áreas temáticas. El centro más productivo, el Hospital Clínico de Barcelona y la comparación del factor de impacto medio y del índice de Narin con la media de España en cada uno de los temas. Se introduce, además, el indicador factor de impacto relativo (FIR), que informa para cada especialidad temática si el hospital ha publicado en revistas por encima (FIR superior a 1) o por debajo (FIR inferior a 1) de la media de España.

Entre los centros sanitarios más productivos cabe señalar que el Hospital Clínic i Provincial de Barcelona destaca tanto por el número de artículos como por su FIR superior a 1 en los siguientes temas: Gastroenterología, Medicina Interna, Sistema Respiratorio, Hematología, Inmunología, Cirugía y Urología. El Centro Especial Ramón y Cajal de Madrid destaca por el número de artículos y FIR superior a 1 en Bioquímica, Microbiología, Urología y Neurociencia.

La Ciudad Sanitaria 12 de Octubre de Madrid, en Cirugía

(FIR superior a 1) y Neurociencias.

En la Facultad de Medicina de la Universidad Autónoma de Madrid destacan las Neurociencias, la Bioquímica y Biología Molecular y la Inmunología (FIR superior a 1). En la Facultad de Medicina de la Universidad Complutense de Madrid sobresalen la Endocrinología, las Neurociencias y la Farmacología (ésta con FIR superior a 1).

En conjunto, a pesar de que la investigación en algunas especialidades se publica en revistas con Factor de Impacto igual o superior a la media del mundo, la comparación entre los factores de impacto esperados con los observados por cada especialidad demuestra que, en general, las citas que reciben los trabajos están por debajo de la media mundial. Por otra parte, el análisis de los centros más productivos en cada especialidad temática demuestra que, en algunos casos significativos, no existe una relación positiva entre la cantidad de trabajos producidos y el factor de impacto medio de las revistas donde han sido publicados. En este sentido, se observa que algunos centros con producción discreta, publican sus trabajos en revistas cuyo factor de impacto medio es superior al de las revistas donde publican algunos de los centros más productivos.

En el caso de España, que los temas de Anatomía, Dermatología, Fármacos/Adicción, Gastroenterología, Genética/Herencia, Microbiología, Reumatología y

Urología/Andrología tienen una producción superior a la que se podría esperar de España según su producción total en biomedicina, y también que son los que reciben más citas de las que les correspondería, teniendo en cuenta las que esos campos reciben como media en el mundo. (CAMI ET ALL 1993).

La reciente publicación del primer volumen del índice de Citas e Indicadores Bibliométricos de Revistas Españolas de Medicina Interna y sus especialidades permite disponer de un instrumento para la obtención de indicadores bibliométricos que pueden resultar de utilidad para la evaluación de la actividad científica del sector, unidos a los disponibles hasta ahora y a la siempre imprescindible valoración de los expertos en la correspondiente área médica.

El nuevo índice recoge las citas que aparecen en los trabajos publicados durante 1990 en 24 revistas: Acta Pediátrica Española, Actas Dermosifiliográficas, Allergologia et Immunopathologia, Anales Españoles de Pediatría, Anales de Medicina Interna, Angiología, Archivos de Bronconeumología, Atención Primaria, Clínica e Investigación en Arteriosclerosis, Endocrinología, Enfermedades Infecciosas y Microbiología Clínica, Gastroenterología y Hepatología, Inmunología, Medicina Clínica, Nefrología, Neoplasia, Neurología, Revista Clínica Española, Revista Española de Cardiología, Revista Española de Enfermedades Digestivas, Revista Española de Geriatria y Gerontología, Revista Española de Pediatría, Revista Española de Reumatología y Sangre. Como

es habitual, la selección de estas revistas "fuentes" o "citadoras" se ha hecho asociando dos criterios: Valoraciones de expertos en la correspondiente área médica e indicadores bibliométricos procedentes de trabajos de nuestro grupo durante las dos últimas décadas, que han sido recogidos en una reciente revisión. Después veremos que dicha selección irá cambiando en futuros volúmenes, de acuerdo con la trayectoria de ambos criterios.

Para evitar posibles confusiones, conviene recordar que desde el trabajo, ya clásico, de Krauze e Hillinger (1971) en los estudios bibliométricos se distingue entre "citas" (que una publicación recibe de otras posteriores) y "referencias" (que una publicación hace de otras anteriores).

Otro patrón de la literatura científica firmemente establecido por la investigación bibliométrica es la distribución de las citas por géneros documentales. Recordemos que, a diferencia de lo que sucede en las ciencias sociales y las humanidades, donde predominan los libros, en las ciencias experimentales o de la naturaleza, la información se transmite principalmente a través de artículos de revistas (que suman más del 80% de las citas), seguidas de lejos por los libros (en torno al 10% de las citas) y por otros géneros documentales de peso mucho más limitado.

Hasta ahora estamos anotando indicadores que permiten afirmar que el consumo de información que sirve de base a la

producción científica española sobre medicina interna y sus especialidades es "normal" conforme a los patrones internacionales (LÓPEZ PIÑERO ET All 1994).

Los indicadores de producción que pueden utilizarse para la evaluación tanto de autores como de instituciones, que a este respecto han de considerarse como autores colectivos, son el número de publicaciones y el índice de productividad de Lotka referidos a libros, artículos de revista y memorias e informes de circulación limitada. De acuerdo con los patrones que ya hemos considerado, para los del primer grupo, los más importantes serán con gran diferencia los correspondientes a los artículos; para los de las áreas médico-sociales, los referentes a los libros, aunque sin descuidar los otros dos epígrafes; para los prácticos hay que situar en primer plano los indicadores de memorias e informes de circulación limitada, y recordar siempre el modesto relieve que los indicadores bibliométricos tienen para la evaluación en este terreno.

Inseparables de dichos indicadores de producción es, en este caso, el índice firmas/trabajo. En primer lugar, por la correlación positiva, entre el número medio de firmas que aparecen en las publicaciones de un autor o institución, su índice de productividad y su posición dentro de la comunidad científica. En segundo lugar, porque el predominio de trabajos en colaboración obliga a manejar en la práctica el índice de productividad fraccionaria(LÓPEZ PIÑERO ET All 1992).

Mundialmente es conocida la valoración de los trabajos a través del Factor de Impacto de las revistas soporte de ellos, pero este parámetro aunque es mucho, no lo es todo. El Journal Citation Report (SCI) refleja los diferentes índice de Impacto de las revistas clasificadas por especialidades donde se valoran puntualmente todas las publicaciones y a través de sus parámetros se estudian las diferentes especialidades. Por la aceptación de sus publicaciones, se consigue conocer la calidad de las actuaciones médicas y el nivel científico de los países.

Utilizando el Factor de Impacto realizamos el presente trabajo con el fin de intentar conocer la cantidad y calidad de las publicaciones sobre trasplante renal y ciclosporina.

III.- OBJETIVOS E HIPÓTESIS

III.- OBJETIVOS E HIPÓTESIS

Se pretende establecer el marco de producción científica sobre el que se desenvuelve la actividad de los autores e instituciones más importantes en el campo del trasplante renal y "ciclosporina", según el hospital o institución, el país, la revista de publicación o de citación y el autor, desde el año 1.986 al año 1.992.

Dentro de este trabajo de investigación se deben tener en cuenta unos objetivos de tipo general y otros de tipo específico.

1.- OBJETIVO GENERAL:

Aportar un procedimiento para el análisis de la producción científica aplicándolo en el caso particular del trasplante renal y ciclosporina.

2.- OBJETIVOS SECUNDARIOS:

- * Calcular la productividad científica total de cada autor, mediante una original aplicando la fórmula matemática, propuesta en este trabajo.
- * Determinar el parámetro indicativo de la calidad del investigador a través de sus publicaciones.
- * Conocer la influencia de diversas variables como la posición del autor en el total de firmas, el Factor de Impacto de la revista, que inciden en su propia valoración.
- * Identificar si la cantidad de trabajos publicados de cada autor suple la calidad científica.
- * Examinar la procedencia geográfica de los mejores autores por país y centro de trabajo.

La hipótesis de trabajo es:

I .- HIPÓTESIS CONCEPTUAL

Los indicadores de valoración bibliométrica mejora la calidad de las herramientas disponibles en la gestión de la actividad de los autores e investigadores por la importancia y el número de publicaciones.

IV.- MATERIAL Y MÉTODOS

IV.- MATERIAL Y MÉTODOS

En este trabajo se estudia la productividad total a través de la relación: Posición de la firma/total de firmantes; Factor de impacto (FI)/ Máximo FI en su especialidad (de la revista); posición de la revista en la tabla de la especialidad/total de revistas; número de publicaciones del autor, durante los años 1.986 al año 1.992.

1.- MATERIAL EMPLEADO

Para la realización de la investigación, se ha empleado como fuente de datos una revisión bibliográfica de todo lo publicado en el INDEX MEDICUS (MEDLINE) 1986-1992, interrogando con las palabras clave KIDNEY TRANSPLANTATION AND CYCLOSPORINS.

La recogida se realiza a través del volcado informático de los datos procedentes de MEDLINE en soporte CD-ROM y procesado por el programa informático MEDIBIB, que realiza la importación de las referencias biomédicas, realizando posteriormente la valoración mediante el programa BIBLIZU.

En el apartado bibliográfico se utilizan índices bibliográficos informatizados, junto con un archivo personal en base a búsquedas de tipo manual.

El programa MEDIBIB v2.50 es un sistema automatizado de gestión bibliográfica, original de A. Baroja y de J.A. Líbano, realizado en lenguaje base Clipper, que actúa sobre referencias bibliográficas procedentes de colecciones de CD-ROM, y proporciona un fichero conteniendo tales referencias homogeneizado y homologado a las normas del estilo Vancouver.

BIBLIZU es otro programa original, creado a medida, por Koldo Saez y J.A. Líbano, también en lenguaje base Clipper, compuesto pues efectúa las operaciones correlativas siguientes:

1ª acción realizada por PRODUCTAL.exe que actuando por el fichero creado por MEDIBIB discrimina las referencias con y sin F.I., produciendo dos ficheros separados.

2ª acción efectuada mediante la aplicación de la fórmula matemática contenida en el archivo AVERAGE.exe para producir el fichero con las tablas numéricas y el resultado logarítmico final.

Equipo Básico:

1º) Lector de CD-ROM: HITACHI CD-ROM DRIVE SYSTEM, para realizar las búsquedas en las bases de datos referenciales.

2º) La introducción de datos se realizó en un Ordenador PC, con un microprocesador Pentium INTEL a 120 Mhz, una memoria RAM de 8 Mb y una memoria en disco duro de 1 Gb.

32) El software empleado con las pertinentes licencias legales para su utilización.

42) La Impresora HP Deskjet 660C. * Hewlett Packard LaserJet serie II.

2.- METODOLOGÍA

2.1.- FASES DEL MÉTODO CIENTÍFICO

La metodología que se sigue para la realización del presente trabajo emplea las diferentes fases del método científico:

A.- Fase Heurística o de acceso a la documentación.

B.- Fase Crítica o de lectura.

C.- Fase Hermenéutica o de interpretación.

A.- Fase Heurística o de acceso a la documentación.

En primer lugar recopilamos y revisamos la información obtenida y profundizamos entre la diversa documentación existente sobre Trasplante Renal y Ciclosporina.

Para conseguir esta información se han consultado diversas fuentes bibliográficas que vienen recogidas en el apartado concerniente a bibliografía.

La búsqueda de la información se ha efectuado a través de volcados informáticos de los registros contenidos en las bases de datos de los repertorios bibliográficos, para lo que se utilizaron datos procedentes de MEDLINE en soporte CD-ROM.

De esta forma logramos referencias documentales existentes en relación a los perfiles de búsqueda más adelante señalados.

La información conseguida fue posteriormente seleccionada de forma meticulosa, descartando las referencias que no se encuadran con el objetivo del estudio, lo que nos permite obtener los artículos y referencias más acordes a nuestros objetivos de investigación.

Incluso, después, se recuperaron los originales de los diferentes artículos seleccionados.

B.- Fase Crítica o de lectura.

Una lectura detallada de todos y cada una de las publicaciones obtenidas, nos condujo a la creación de un fichero ordenado y clasificado para su empleo posterior.

C.- Fase Hermenéutica o de interpretación.

Finalmente la lectura y clasificación de los documentos, permiten la consecución de resultados y elaboración de conclusiones de este trabajo de investigación.

2.2.- SELECCIÓN DE LA POBLACIÓN ANALIZADA:

Diseño del estudio:

- * Estudio descriptivo.

Población del estudio:

- * Todo lo publicado en el INDEX MEDICUS (MEDLINE) durante los años 1986-1992, mediante la fórmula de interrogación con las palabras clave KIDNEY TRANSPLANTATION AND CYCLOSPORINS.

2.3.- OBTENCIÓN DE LA INFORMACIÓN

La gestión de la bibliografía de forma correcta requiere:
Incorporar automáticamente las búsquedas realizadas sobre el
CD-ROM en los ficheros del usuario, con lo que ello conlleva:

- Comodidad y rapidez.
- Evita errores de transcripción.
- Transforma los campos atípicos en campos estándares.
- Admite la introducción de fichas propias.
- Prepara listados mediante búsquedas, adaptadas a las normas internacionales.

Para todo esto utilizamos el programa MEDIBIB, que nos proporcionaba toda la gestión de la información.

Utilizamos un perfil amplio de palabras clave relacionadas con la actividad clínica e investigadora básica. Las palabras son recogidas de los artículos originales tanto en el título, como en sus MESH (Medical Subject Heading) de la National Library of Medicine, como en el texto de sus abstracts e incluso en los nombres de los autores.

El colectivo está integrado por 5.276 autores cuyas

publicaciones están contempladas en el JCR procedentes de 2.122 artículos.

Para conocer si un trabajo está realizado en España ha sido necesario utilizar las diferentes etimologías de la nación y de sus principales ciudades. Por otro lado existen hospitales hispánicos no españoles, ciudades con el mismo nombre pero de diferente nacionalidad que era preciso descartar.

Las palabras claves relativas a la nacionalidad de los trabajos han sido:

SPAIN, BARCELONA, VALENCIA, SEVILLA, MADRID, VIZCAYA, CORDO*, ASTURI*, GRANADA, AVILA, ZARAGO*, SALAM*, NAVARRA...

Los diferentes artículos eran analizados individualmente para detectar la aparición de falsos positivos (artículos que no eran realizados en España o no pertenecían a la especialidad Nefrología y Urología). Todos ellos fueron desechados.

Los falsos negativos (no aparecen en la búsqueda los artículos que debían) se localizaban con la utilización de diferentes palabras clave e incluso referenciando la búsqueda a personas individualizadas.

Una vez presumida la obtención de todas las publicaciones, comenzamos a asignar valores numéricos a cada

publicación. Todos los valores eran recogidos en bases de datos sobre el PC personal.

Basándonos en los principios asumidos y reflejados anteriormente, asignábamos una serie de valores ligados al factor de impacto de la revista reflejada en la publicación JCR (SCI), factor de impacto de la revista 1 de su especialidad; total de revistas de la especialidad; posición (rango) de la revista en la escala de su especialidad; número de autores firmantes del trabajo, siendo 3 el máximo considerado; posición de cada autor (rango) en el total de firmantes; número de publicaciones por autor en los seis años.

Para la asignación del número de publicaciones por investigador, fue preciso descomponer la secuencia de autores firmantes en sus diferentes personas, con un programa informático. Esta desintegración nos proporcionó el número de publicaciones por autor. Ello se realizó después de integrar todas las publicaciones de los diferentes años en un solo fichero común donde cada autor tiene sus valores referidos anteriormente y su relación con otras bases de datos relacionales donde se contemplan los valores asignados a las revistas del JCR.

Informáticamente se daban los valores por autor y aquellas publicaciones que carecían de FI eran volcadas a un fichero independiente para posteriormente ser analizadas por si fuesen revistas de cambio de nombre, de nueva aparición o

de nombre modificado. Este fichero era contrastado trabajo a trabajo para encontrar la causa de la no inclusión en el JCR.

De la base de datos de autores individualizados con sus valores por cada publicación también individual y englobada en el soporte informático, realizamos un tratamiento matemático de cada publicación poniendo en relación los seis valores anteriores (ver formula matemática), con el fin de conseguir una cifra relacional que denominamos INDICE DE PRODUCTIVIDAD por publicación.

La fórmula utilizada después de seguir un ajuste personal, ajuste de las cifras de los integrantes de los diferentes equipos de investigadores, cifras altas para los premios Nobel y ultimada en tanteo, por el procedimiento ensayo/error fue:

$$FI*AT*AT*RT$$

IP===== para cada publicación

$$FM*AN*RN$$

Para conocer la Productividad Total por Autor se realizó el cálculo sumatorio:

n

donde $PT = \sum IPI$

i=1

FI = Factor de Impacto.

FM = Factor de Impacto de la revista número uno de la especialidad.

AN = Autor Número, posición del autor entre los firmantes del trabajo.

AT = Autores Totales, total de autores firmantes.

RN = Revista número, posición de la revista entre el total de su especialidad.

RT = Revistas Totales, total de revistas de la especialidad.

IP = Indice de productividad por artículo.

Pt = Productividad Total (del total de los artículos).

AN y AT son relacionados en tanto por ciento, lo mismo que RN y RT.

Es bien conocido que los autores Watson y Crick, describieron en el año 1953 la estructura del ADN y fueron premiados con el Nobel de Medicina en 1962, con un sólo trabajo publicado es Science. Entre otros, éste fue un caso que se utilizó para matizar los resultados a través de un tanteo matemático.

Además en el transcurso del desarrollo matemático, nos encontramos con el mismo IP para autores del mismo equipo

investigador. Eran muy perjudicados los directores del trabajo y la firma consecuente en últimos lugares, lo que fue compensado al ser sumatorios los IP de cada trabajo corregido con el AT. Lo cual ocurre en las publicaciones de los diferentes equipos dirigidos por el mismo director.

Obtenida las cifras totales de productividad PT (aplicando el proceso sumatorio), en procesos sucesivos se ajustaron los valores premiando los trabajos impresos en revistas primarias de las diferentes especialidades con el fin de poder comparar aquellas que tuviesen poco IP a pesar de ser las primeras en sus listas. Ello se consiguió a través de la transformación de las revistas en una escala única en base 100. Los valores eran de gran componente numérico y por ello se realizó el cálculo logarítmico en base diez.

Cotejamos cada publicación de los seis parámetros de PT, analizando la calidad de la revista, el título y abstracts del trabajo, el número de firmas. La búsqueda se realiza utilizando las mismas palabras clave referentes a trasplante renal y ciclosporina.

Finalmente se efectuó un cálculo de correlación estadístico entre las seis variables del producto final PT (todos con todos).

Los estudios realizados a colectivos sucesivos tienen la bondad de manejar datos procedentes de fuentes diferentes: 12)

datos ligados a las apetencias del autor (posición en la firma, número de componentes firmantes, número de trabajos realizados), 29) a las características proporcionadas por el JCR y 39) a los valores de forma original.

2.4.- ESTRUCTURA DE LAS BASES DE DATOS

Se describen a continuación los ficheros finales en los cuales se ha volcado la información.

* LOGREN.dbf

Incluye los registros de todos los autores e indica el número total de artículos por autor, siendo ordenado por el número de artículos de mayor a menor.

2.5.- ANÁLISIS ESTADÍSTICO:

Todos los datos del estudio se codificaron según el protocolo expuesto. Para su posterior análisis fueron introducidos mediante volcado informático en un ordenador PC y procesados con el programa BIBLIZU.

En primer lugar, tras la introducción de los datos, se procedió a la depuración de los mismos.

Para las variables cualitativas se han realizado tablas de frecuencia de cada variable.

Se obtuvieron las cifras totales de productividad PT aplicando el proceso sumatorio. En procesos sucesivos se ajustaron los valores premiando los trabajos impresos en revistas primarias de las diferentes especialidades con el fin de poder comparar aquellas que tuviesen poco IP. Las revistas se ordenaron en una escala única en base 100. Los valores eran de gran componente numérico y por ello se realizó el cálculo logarítmico en base diez.

Finalmente se realizó un cálculo de correlación estadístico entre las siete variables del producto final PT (todos con todos).

2.6.- MANEJO DE LAS BASES DE DATOS

PANTALLA 1

PROYECTO DOSIS-2000 Líbano/Bassam	UNIVERSIDAD COMPLUTENSE DE MADRID	Prof. Pedro Navarro
--------------------------------------	-----------------------------------	---------------------

Valoración de autores registrados en Medline: 1986-1992	
TRANSPLANTE RENAL Y CICLOSPORINA.	
(c) J Libano	Biblizu 1.1

MANEJO DE LAS BASES DE DATOS

PANTALLA 2

El presente programa pretende proporcionarle la valoración de todos los autores que han publicado sobre : TRANSPLANTE RENAL y CICLOSPORINA y cuyas publicaciones fueron recogidas en el MEDLINE CD-ROM en los años 1986 a 1992. Los artículos estudiados se reflejan sobre el Campo: REVISTA SOPORTE y de ellos se obtiene el concepto de PRODUCTIVIDAD TOTAL (PT) elaborado de forma original para investigaciones académicas.

Los valores se presentan en tres bases de datos originales: RENOTRA2.DBF contiene los autores individualmente con sus trabajos, y los valores ocasionados por los mismos; RENOLOG.DBF aporta por cada autor: la valoración PT, el número de artículos y la Media Aritmética (MA) de los diferentes valores contemplados para el cálculo de la PT; RENREPES.DBF engloba los artículos que no tienen Factor de Impacto (FI).

Las hileras de los autores firmantes se descomponen en investigadores únicos y se ofrecen de cada uno de ellos: la posición en la firma, el total de firmas, el FI de la revista soporte, el FI del la revista n° 1 de la especialidad, el Total de revista de la especialidad y la posición de la revista en esa escala.

Los datos de FI, FI máximo, Total de revista y Rankin, son tomados del Journal Citation Report 1988 del Science Citation Index. Dichos datos, más el n° publicaciones, n° de autores, posición en la firma y n° de veces que firma como primer autor, son la cifras para calcular la PT.

V.- RESULTADOS

V.- RESULTADOS

Los resultados que obtenemos son múltiples y referidos tanto al proceso original de valoración como datos de relaciones entre los autores, publicaciones y revistas, que caracterizan la recuperación de referencias en el INDEX MEDICUS (MEDLINE) 1986-1992, mediante las palabras clave KIDNEY TRANSPLANTATION AND CYCLOSPORINS.

El análisis de los datos (Ver Anexos) de nuestra valoración de la PT nos proporciona cinco factores principales agrupando a los productores bibliográficos en :

Factor 1º. Autores con gran número de publicaciones en revistas pioneras de la especialidad consiguiendo gran PT.

Factor 2º. Autores firmantes en primera posición, muchos artículos como primer firmante, pocos firmantes, en revistas de gran FI Máximo, sus trabajos se contemplan en revistas medias de su especialidad con gran número de revistas.

Factor 3º. Autores que firman en posiciones de retaguardia, pocos artículos como primer firmante con muchos autores, gran FI en su especialidad y muchas revistas.

Factor 4º. Autores que firman en posiciones de retaguardia con poco FI en revistas zagueras.

Factor 59. Autores que firman muchos artículos como primer firmante y tienen muchas publicaciones.

(Tabla 1)

En primer lugar se ofrecen los datos cuantitativos básicos pertenecientes a los autores que publican sobre Trasplante Renal y Ciclosporinas en la búsqueda efectuada en MEDLINE, aunque determinadas revistas no tuviesen índice de impacto. El número total de autores es de 5.276 de los cuales son españoles 131 y concretamente 49 de la Comunidad Autónoma de Madrid integrados en grandes centros de producción, como son el hospital "12 de Octubre", el hospital Gregorio Marañón, el hospital Ramón y Cajal, y el hospital La Paz.

TABLA 1 - DATOS BASICOS

	TOTAL AUTORES	AUTORES ESPAÑOLES	AUTORES DE MADRID	TOTAL ARTICULOS
DATOS	5.276	131	49	2.122

(Tabla 2)

Los autores reflejados en la Tabla 2 se estudiaron de forma individual, encontrando una explicación conveniente a los valores reflejados en la PT. Los resultados recogidos en la siguiente Tabla representan el número de publicaciones aparecidas en MEDLINE en los diferentes años incluidas o no en el JCR. Junto con la media aritmética del:

a) Factor de Impacto Máximo alcanzado por la revista número uno de su especialidad en cada trabajo.

b) Factor de Impacto de la revista soporte.

c) Posición de la revista en el listado de su especialidad.

d) Número total de revistas de su especialidad.

El total de autores estudiados es de 5.276. El autor que más artículos publico fue KAHAM, DB, con un total de 80, seguido de VAN BUREN, CT que tiene 46 y le siguen NAJARIAN, JS con 45 y SUTHERLAND, DE, con 37.

TABLA 2 - CLASIFICADA POR NÚMERO TOTAL DE ARTÍCULOS

GRÁFICO 1 - DISTRIBUCIÓN DE AUTORES POR NUMERO DE ARTICULOS

(Tabla 3)

En la tabla 3 se describe la Productividad Total en orden decreciente entre los máximos autores. Se acompaña del número de artículos totales, los recogidos en el SCI, el valor medio aritmético del puesto que ocupa entre los firmantes, la media aritmética del número de autores que participan por artículo, la media del Factor de Impacto de las revistas soporte de los trabajos y el puesto correspondiente de dichos autores en la Tabla 2 (clasificada por número total de artículos).

A continuación se describen los diez autores con una productividad total más elevada. Como se aprecia el autor que mantiene una Productividad Total más elevada es NAJARIAN, JS con 12.47 seguido de SUTHERLAND, DE, con 12.44, y de FRYD, DS con 11.34, CANAFAX, DM con 11.34, MORRIS, PJ con 11.25, VAN BUREN, CT con 10.96, SIMMONS, RL con 10.92, PAYNE, WD con 10.71, MATAS, AJ con 10.59, LUNDGREN, G con 10.11.

GRÁFICO 2 - DISTRIBUCIÓN DE AUTORES POR PRODUCTIVIDAD

GRÁFICO 3 - COMPARATIVA DE AUTORES

RELACIÓN DE LOS AUTORES CON UNA MAYOR PT Y SU COMPARATIVA CON EL NUMERO DE ARTICULOS PUBLICADOS

- 1 .- NAJARIAN, JS
- 2 .- SUTHERLAND, DE
- 3 .- FRYD, DS
- 4 .- CANAFAX, DM
- 5 .- MORRIS, PJ
- 6 .- VAN BUREN, CT
- 7 .- SIMMONS, RL
- 8 .- PAYNE, WD
- 9 .- MATAS, AJ
- 10.- LUNDGREN, G
- 11.- KAHAN, BD

Como podemos apreciar el número de artículos publicados por los diferentes autores con una Productividad Total más elevada tiene unas importantes variaciones.

Los once autores que tienen un Log. Total superior a 10.05 consiguen esta puntuación gracias al índice de impacto y a su puesto de firma fundamentalmente.

El autor NAJARIAN, JS tiene un Log. Total de 12.47 con 45 artículos publicados durante estos años y SUTHERLAND, DE tiene 12.44 de Log. Total con muchos menos artículos 37.

El autor FRYD, DS con 31 artículos se encuentra en tercer lugar con 11.39 puntos y CANAFAX, DM con sólo 19 artículos esta en un excelente cuarto lugar.

El autor MORRIS, PJ está en quinto puesto con 11.25 puntos y VAN BUREN, CT con nada menos que 46 artículos recogidos alcanza un Log. Total de 10.95.

Es significativo el caso de KAHAN, BD que pese a poseer la cifra de 80 artículos se encuentra en el puesto undécimo con 10.06 puntos.

No es menos llamativo el puesto tan importante que ocupa LUNDGREN, G que con sólo 16 artículos se sitúa en el décimo lugar con 10.11 puntos de Log. Total.

(Tabla 4)

En la tabla 4 se describen las revistas ordenadas alfabéticamente. Se acompaña de la especialidad en que está incluida, el rankin, el factor de impacto, el impacto máximo, el número total de los que existen en la especialidad y el half cited.

El número de revistas utilizadas en el estudio indicando la especialidad de cada revista y su ponderación dentro de su especialidad fue de 2.485. y 2.122 artículos se examinaron de forma individual.

(Tabla 6)

En la Tabla 6 se presentan los autores que trabajan en centros de la Comunidad Autónoma de Madrid, junto con el total de artículos y con el índice de productividad total.

Como podemos apreciar los autores con un índice de productividad mayor no son los que publican un mayor número de artículos, influyendo de forma decisiva el resto de las variables. ANDRES,A publico 15 artículos (8,55 de productividad), MORALES,JM publico 15 artículos (6,98 de productividad), PRIETO,C publico 13 artículos (8,19 de productividad) y RODICIO,JL publico 14 artículos (7,50 de productividad).

Es de destacar que un autor PATERNINA,ER y RODRIGUEZ PATERNINA,E al firmar sus artículos de forma distinta se considera como dos autores diferentes.

VI.- DISCUSIÓN

VI.- DISCUSIÓN

Aunque promediado el siglo XIX se acumularon datos estadísticos y se hicieron diversas interpretaciones de los mismos, no fue hasta 1951 -es decir, aproximadamente, 100 años después- cuando Price formuló adecuadamente la ley de crecimiento exponencial de todos los aspectos medibles de la ciencia. Pero fue en 1963, en que el capítulo inicial de su libro Little science, big science el que alcanzó amplia difusión.

Utilizando un abundante material estadístico, Price formuló una ley general aplicable a la ciencia, desde el siglo XVII hasta la actualidad, según la cual la forma normal de su crecimiento es exponencial. La tasa de crecimiento de la ciencia en un momento dado es, por tanto, proporcional al tamaño total hasta entonces adquirido, al igual que en el crecimiento de fenómenos sociales y biológicos, sea el de la población mundial, el de los kilómetros de ferrocarril instalados a comienzos de la revolución industrial, etc.

Una característica del crecimiento exponencial de la ciencia es que su ritmo es mucho más rápido que el de la mayoría de los fenómenos sociales. En lo que la población se duplica cada cincuenta años y la renta de los países desarrollados cada veinte, el tamaño de la ciencia y, en concreto, el de la literatura científica, se convierte en el doble

solamente en diez años si se utiliza una concepción amplia de la misma, o en quince años si se define de modo más exigente. Así, cada quince años se duplica el número de revistas científicas y de resúmenes de todos los campos de la ciencia pura y aplicada, y también el de compuestos químicos conocidos y el de miembros de instituciones científicas.

Price, sin embargo, consideró que esta ley normal del crecimiento exponencial corresponde a una situación muy anormal. El crecimiento exponencial no sería otra cosa que el tramo ascendente de dicha curva logística. Estudios posteriores parecen demostrar esta hipótesis.

Las investigaciones sobre la productividad de los autores científicos, iniciadas en el siglo XIX por Francis Galton, consiguieron su primer resultado de interés cuando Lotka pudo demostrar en 1926 que la distribución trabajos/autor obedecía a una ley similar a la comprobada en la productividad biológica. Con independencia de la disciplina científica y con la única condición de que la bibliografía recogida sea lo más completa posible y cubra un período de tiempo suficientemente amplio, encontró que el número de autores que publican n trabajos es inversamente proporcional a n^2 .

El índice de productividad, el logaritmo del número de publicaciones, es uno de los indicadores bibliométricos fundamentales, lo que explica que a la ley de Lotka se haya dedicado un gran número de estudios.

Sobre la base del índice de Lotka se acostumbra a distribuir los autores de un conjunto determinado de publicaciones en tres niveles de productividad: pequeños productores (con un solo trabajo y un índice de productividad igual a 0), medianos productores (entre 2 y 9 trabajos e índice de productividad mayor que 0 y menor que 1) y grandes productores (10 o más trabajos e índice de productividad igual o mayor que 1). Aparte de su función de resumen, esta distribución sirve para obtener lo que Price llamó índice de transitoriedad, es decir, el tanto por ciento que en un conjunto determinado de publicaciones, corresponde a los autores ocasionales o transitorios (los de un solo trabajo), que disminuye en los temas, disciplinas o países de actividad científica bien consolidada.

Con la finalidad de superar el carácter relativo de los indicadores de impacto basados en el cómputo de citas se ha propuesto una amplia serie de procedimientos, entre los que destacan el que Narin y Pinski llaman "método de las influencias ponderadas" y las varias tasas relativas de citas de Braun et al. y Schubert y Gränzel. El primero, que parte de la idea de que el "índice de influencia" de una revista puede medirse mediante el cociente de las citas que recibe y las referencias que emite, se basa en el cálculo matricial. Sin embargo, los indicadores que proporciona este método y también las tasas relativas de citas propuestas por estos autores son de ejecución nada sencilla y de interpretación discutible, lo que resulta poco rentable si se limitan, como sucede en ambos

casos, a los datos procedentes del Science citation index. (LÓPEZ PIÑERO ET ALL 1992).

Al examinar las frecuencias de citación de artículos publicados en distintas revistas y por distintos grupos de investigación, no hubo, virtualmente, correlación alguna entre la frecuencia de citación y el índice de impacto de la revista correspondiente. Esto no fue del todo inesperado: la aceptación de un artículo por una comunidad científica depende (junto con algunos otros factores) del contenido de dicho artículo más que de donde se ha publicado. (SEGLEN 1993).

Atendiendo al FI, existe una baja contribución de las revistas españolas a las ciencias biomédicas, que es mayor en las revistas básicas que en las clínicas. Factores como el idioma y la inclusión en el SCI podrían explicar, al menos parcialmente, los bajos FI obtenidos. (BAÑOS ET ALL 1992).

En relación a los indicadores bibliométricos y las valoraciones de los expertos en las distintas áreas de las ciencias médicas. Debe descartarse el uso de las evaluaciones de indicadores bibliométricos aislados o de carácter absoluto.

Los indicadores bibliométricos, lejos de servir de coartada para evitar debates y enfrentamientos como se hace en la práctica que antes hemos denunciado, tienen que asociarse en todas las evaluaciones a las valoraciones de los expertos de la correspondiente área de las ciencias médicas. (LÓPEZ

PIÑERO, TERRADA 1992).

Un examen crítico adecuado sobre los índices de repercusión, y en concreto los más sencillos, el número de citas, el índice de visibilidad y el factor de impacto, son los instrumentos bibliométricos de mayor importancia para la evaluación de la actividad médico-científica de autores e instituciones, junto a los de productividad circulante. El límite general de su aplicación puede determinarse fácilmente, considerando si la fuente de la que procede corresponde a la repercusión que se trata de evaluar. (LÓPEZ PIÑERO, TERRADA 1992).

A pesar del crecimiento de la producción española en biomedicina, España aún ocupa el séptimo puesto de la CE. Madrid y Barcelona concentran notablemente la investigación biomédica que procede de la red hospitalaria. La relativización de los datos describe la existencia de otras áreas geográficas sobresalientes, de las que no es ajena la Universidad. La difusión cada vez mayor de las publicaciones contrasta con las citas alcanzadas de los trabajos, lo cual puede ser el resultado de fenómenos relacionados con la calidad de los trabajos y/o el reconocimiento de las publicaciones firmadas por autores españoles. (CAMI ET ALI 1993).

Entre las características del estudio realizado, queremos destacar que la producción científica realizada y publicada en

revistas internacionales, fundamentalmente en inglés, es la que tiene mayores probabilidades de difusión y reconocimiento en el ámbito de la comunidad científica de influencia anglosajona, comunidad que hoy ostenta el liderazgo en cuanto a intercambio científico se refiere. La elección de la base de datos del Science Citation Index (SCI) se debe a que es la única que recopila la bibliografía de los trabajos indizados y, por tanto, permite hacer análisis de citas.

Siendo consciente de las limitaciones y sesgos de la fuente de datos, el presente trabajo no es un estudio de toda la producción científica sobre estudio de la productividad bibliográfica sobre trasplante renal y ciclosporina, sólo recoge el período 1986-1992. Tampoco es un estudio de la producción científica española que puede ser reconocida por la comunidad científica mundial. La base de datos SCI recoge lo publicado en la mayoría de revistas internacionales y en solamente cinco revistas españolas. Para obtener una panorámica completa de la producción española en biomedicina, estos 11.103 documentos deberían sumarse a los de la base de datos del Índice Médico Español (IME), que indiza un total de 321 revistas españolas de medicina. En el período 1986-1992 esta base de datos tenía recogidos un elevado número de documentos, mayoritariamente artículos de revista. A pesar de ello, consideramos que los documentos analizados en el presente estudio son los que tienen una mayor posibilidad de reflejar la producción científica española de mejor calidad y/o aquellos que tienen mayor probabilidad de ser difundidos y

reconocidos como la aportación española. Por lo tanto, dadas las limitaciones conceptuales existentes, conviene resaltar diversas consideraciones metodológicas. Tanto los análisis bibliométricos cuantitativos como los cualitativos no permiten la comparación entre distintas áreas del conocimiento.

Por ello, debe darse mayor valor a las comparaciones que se han efectuado dentro de una misma temática y ser mucho más críticos en aquellas agrupaciones que se han realizado de acuerdo con zonas geográficas y aún más, cuando se ha tratado de comparar la producción entre diversos centros.

La mayoría de los análisis globales se han efectuado sólo bajo la perspectiva cuantitativa, si bien ninguna publicación supone una contribución idéntica a cualquier otra y sólo una determinada y reducida parte del material publicado será leída y tomada en cuenta por terceros.

En el presente trabajo, se tratan separadamente los resúmenes de congresos de los artículos, ya que ambos reflejan distintos aspectos de la producción científica. Las presentaciones a congresos muestran la investigación más reciente, no necesariamente pasan controles de calidad estrictos y habitualmente dan lugar a publicaciones en revistas científicas cuando la investigación alcanza una fase más madura. A las presentaciones a congresos se les reconoce otra misión diferente: además de la transmisión de conocimiento, son un vehículo muy importante de relación de

los investigadores entre sí, de darse a conocer en el mundo y favorecen la creación de lo que ya en su día Price denominó "colegios invisibles".

La base de datos del SCI tiene un protagonismo casi exclusivo de la producción de la comunidad anglosajona, tanto en lo que se refiere a la selección de revistas que cubre (y vacía totalmente) como al idioma de las mismas. En cuanto al análisis de citas, el indicador ha de considerarse como un aspecto del impacto que producen los trabajos.

El análisis de citas ha sido muy criticado, pues en el hecho de que se cite o no un artículo determinado inciden muchos factores, algunos de tipo sociológico. Más de la mitad de los artículos de biomedicina no son citados jamás durante los cinco años posteriores a su publicación. Las revistas de más prestigio, los grupos reconocidos internacionalmente, los temas candentes y sujetos a debate son objeto preferente de la citación. Muchos trabajos realizados por autores españoles no obtienen las citas esperadas, lo que puede ser debido tanto a la calidad intrínseca de la investigación como al mayor reconocimiento que, a priori, se le da a la producción de otros países europeos.

Es sabido que las citas que alcanza la investigación básica siempre son superiores a las de la investigación clínica y epidemiológica. También se sabe que los artículos de revisión son los que tienen mayor oportunidad de ser citados.

No pueden compararse directamente los resultados de la investigación en ciencia básica con los de la medicina clínica, ni los factores de impacto obtenidos en distintas áreas temáticas, cada una con sus características y peculiaridades. No obstante, éstas comparaciones están hoy muy extendidas y son objeto de todo tipo de equívocos. En consecuencia, cuando se han analizado comparativamente áreas geográficas, temáticas o centros, el análisis se ha limitado al estudio cuantitativo, ya que no se han podido establecer unas fronteras precisas según el tipo de investigación realizada.

Conviene justificar la utilización de diversos denominadores como factor de corrección, especialmente cuando se comparan centros entre sí. Si se parte del principio que un investigador o grupo de investigadores será más o menos productivo que otro u otros de la misma formación y tradición en función de los recursos de que dispongan (medios económicos y humanos), es fácil aceptar que cuanto mayor sea el centro y mayores sean los recursos de que se disponen, mayor será la producción científica, ya que ésta, en términos de cantidad, siempre tendrá una relación más o menos directa con el tamaño del centro o de sus efectivos.

El establecimiento de rangos o listas no necesariamente expresará la calidad o potencia de los grupos de investigación. La utilización de denominadores aporta una nueva perspectiva para comparar los grupos en función de su

productividad relativa.

En definitiva, la misma actitud que se requiere para la lectura de los resultados y conclusiones que se obtienen en el día a día de la ciencia, es necesaria, o quizá más, para la lectura de los estudios que se realizan en el campo de la investigación sobre la ciencia. Este enfoque ya fue etiquetado en su día por Elkana et al. con el nombre de "eclecticismo disciplinado".

En líneas generales, el 58% de la producción científica se concentra en las Comunidades autónomas de Madrid y Cataluña. La relativización de los datos confirma la existencia de áreas geográficas sobresalientes en investigación biomédica. Al realizar el cociente con el PIB, se introduce el factor riqueza y entonces resaltan las comunidades uniprovinciales de Navarra, Cantabria o Murcia.

Al realizar el cociente con la cifra de habitantes debe considerarse que no sabemos si existe alguna relación homogénea entre el número de científicos de que dispone la investigación biomédica en España, y que la delimitación por CCAA supone comparar zonas de extensiones distintas con desigualdades internas de carácter muy diverso. Por ello, una mejor aproximación quizá consiste en resaltar los datos obtenidos del desglose por provincias en función del número de habitantes. En este análisis, lógicamente Barcelona se acerca más a Madrid, aunque es más importante destacar cómo sobresa-

len las provincias de Salamanca, Granada, Valencia, Córdoba, y León, áreas de producción científica relevante cuyo papel quedaba diluido en la visión por CCAA. Dado el carácter uniprovincial antes aludido, es también lógico que Santander y Navarra sigan destacando como provincias.

La Universidad es responsable del 46% de los documentos y los Hospitales del 39%. Incluso en temas fronterizos con la investigación básica como las Neurociencias y la Inmunología, la aportación procedente de los Hospitales es similar o muy superior. Además, tanto en Madrid (sin tener en cuenta la valiosa aportación del CSIC) como en Barcelona, la red hospitalaria constituye la principal fuente de investigación biomédica. Por lo tanto, puede afirmarse que, de forma indirecta, el Sistema Nacional de Salud contribuye económicamente de una forma muy sustancial a la investigación biomédica española, aunque se desconoce el valor de esta aportación. Sólo existe información global acerca de los recursos que, de forma externa, destinan algunas agencias públicas de financiación, como sería el caso del FIS. Pero en el área biomédica es bien conocido que las fuentes de financiación externas son diversas y no sólo proceden de los fondos públicos (FIS, CICYT, DGICYT, CDTI, Comunidades Autónomas), sino que se presupone que los fondos privados (procedentes de la industria sanitaria) pueden ser tanto o más importantes.

En el área biomédica los recursos externos son sólo una

parte del coste global de la investigación y se desconoce a qué proporción corresponden, ya que las desigualdades organizativas de la investigación en el Sistema Nacional de Salud hacen que no exista uniformidad sobre el modo como se gastan los recursos externos. Además, hay que tener en cuenta los distintos costes de la investigación básica, la investigación clínica y la epidemiológica. La preponderancia de una u otra, ya sea en una área geográfica o en un centro determinado, condicionará la cuantía y el tipo de gasto que se realiza. La investigación biomédica de algunos centros es reconocida no tanto por el volumen global, sino por la existencia de unos grupos muy destacados, los cuales concentran la mayor parte de la producción científica. Quizá sea discutible el que, por definición, toda institución sanitaria está obligada a hacer investigación de nivel y cuanto más grande sea, mayor el número de artículos que se debe esperar de ella. También es cierto que, algunas relaciones inversas observadas en centros de renombre, pueden ser demostrativas de desajustes en la trayectoria de investigación de estos centros.

Por el contrario, la observación de que centros de mucho menor tamaño presentan una producción relativa que se aproxima a la de los centros más productivos, es demostrativo de que la calidad global no está reñida con el tamaño del centro.

La importancia de la existencia de una determinada masa crítica y de un entorno, debería reconocerse el valor de la

producción global de estos centros de menor tamaño.

La comparación de centros entre sí, se debe tener en cuenta, entre otros factores, el tipo de producción científica, el tipo de organización de que disponen para la realización de investigación, la trayectoria de sus facultativos en los últimos 10-15 años, las relaciones con la Universidad o el CSIC si existen, etc.

Las comparaciones más aceptables son aquellas que se hacen en el marco de la misma área temática y en este estudio, se confirma una vez más la necesidad de que se preste mayor atención a los grupos de investigación como unidad de estudio que al propio centro.

En este sentido, se denota la existencia de grupos muy productivos y de gran nivel ubicados en centros y áreas geográficas que no sobresalen en las listas de rangos y, por lo tanto, quedan aislados del contexto global. (CAMI ET ALI 1993).

Existen autores con más artículos publicados que otros considerados en peores puestos según nuestro valor de productividad. Ello se debe a que sus trabajos están editados en revistas de menor calidad (menor índice de impacto y peor posición en su especialidad). También se debe a que el lugar que ocupan en la firma está por detrás. Igualmente nos encontramos con autores que formando equipo se distancian

ligeramente por ocupar un lugar posterior en la firma del trabajo.

Debemos mencionar que autores con gran PT se diferencian de forma importante en el número total de publicaciones, y ocupan un puesto muy retrasado en cuanto a la calidad de ellas.

Es siempre preferible una buena publicación que varias mediocres quedando esto suficientemente claro al analizar la Productividad Total en diversos autores. Las condiciones son: que los trabajos sean realizados por varios autores, que el firmante sea de los primeros, la revista tenga gran índice de impacto y ocupe una posición elevada en la especialidad.

Destacamos que al medir la Productividad Bibliográfica de un autor por el índice de Impacto, son necesarios que transcurran varios años después de publicarse el trabajo; sin embargo, la Productividad desarrollada por el Prof. Líbano et all, el estudio de la Productividad Total se puede conocer en un período muy breve de tiempo.

VII.- CONCLUSIONES

VII.- CONCLUSIONES

1.- Mediante el análisis de la Productividad Total en diversos autores, se ratifica que siempre es preferible una buena publicación que varias mediocres.

2.- Para conseguir un índice de Productividad Total elevado, la revista debe poseer un gran índice de impacto y ocupar una posición elevada dentro de su especialidad.

Por lo tanto un número elevado de artículos no garantiza una Productividad elevada como queda patente en el presente trabajo.

3.- La medición de la Productividad Bibliográfica de un autor por el Índice de Impacto, es necesario que transcurran varios años después de publicarse el trabajo; sin embargo aplicando nuestra fórmula logarítmica, el estudio de la Productividad Total se puede conocer de forma inmediata.

4.- El Índice de Impacto requiere un control muy estricto de la calidad de los datos que se introducen, dada su repercusión en el momento de utilizar la información demandada, lo cual obliga a desarrollar nuevas actividades y trabajos suplementarios, encaminados a depurar y actualizar las bases de datos documentales.

5.- La Productividad Total, como índice bibliométrico, ofrece beneficios, ventajas y aplicaciones prácticas al clarificar la actividad científica de los diferentes autores, para lo cual cuenta en su desarrollo con datos procedentes de fuentes diferentes: posición en la firma, número de componentes firmantes, número de trabajos realizados, a las características proporcionadas por el Journal Citation Reports.

6.- Nuestro nuevo Índice permite diversas vías de investigación. Su utilización produce un valor añadido al estudio de la documentación científica.

7.- Para su aplicación es necesario contar con profesionales con una adecuada formación en estas áreas del conocimiento que hagan posible su desarrollo y su evolución hacia futuros sistemas de análisis documental.

8.- La Productividad Bibliográfica Total sobre trasplante renal y ciclosporina en el período 1986 - 1992 más elevada corresponde a NAJARIAN, JS. con una puntuación de 12.47, seguido por SUTHERLAND, DE. con 12.44. y por FRYD, DS. con 11.39.

Son por lo tanto los autores con una mejor posición dentro de su especialidad en cuanto a la calidad de producción de publicaciones.

- 9.- La evolución del Índice de Productividad Total entre los primeros autores desciende de forma constante, siendo un indicador más estable que el número de artículos publicados.
- 10.- La aportación de este instrumento de análisis de las publicaciones biomédicas, requiere nuevas contrastaciones para su validación científica, pues algunos aspectos metodológicos precisan ser desarrollados partiendo de otras diferentes hipótesis. Sin embargo, esta inicial aproximación abre perspectivas de interés en el ámbito de la documentación científica, y particularmente enriquecedora en la práctica docente, por cuanto provoca elementos de duda sobre las técnicas clásicamente establecidas.
